ULTRA LOW NOISE WIDEBAND PREAMPLIFIER

The ZN460 is a versatile high performance AC preamplifier, designed for applications requiring ultra low noise such as infra-red imaging and low noise wideband amplifiers e.g microphone, acoustic emission, transducer bridge amplifier. The matching of open loop gain, coupled with small physical size, makes the ZN460 ideal for multichannel amplification.

The programmable gain feature allows variable detector gain factors to be trimmed out. The programmable bandwidth feature allows the noise bandwidth to be reduced to the required signal bandwidth, thus minimising the wideband output noise.

FEATURES

- High Controlled Gain : 60dB $\pm$ 1dB typical
- Programmable Gain : 50-60dB typical
- Programmable Bandwidth : 6MHz downwards
- Low Noise : 40 Ω Equivalent Noise Resistance, or 800pV/ $\sqrt{\text{Hz}}$
- Low Supply Current : <3mA from 5V

ABSOLUTE MAXIMUM RATINGS

Supply voltage	6 Volts
Operating Temperature Range:	
for ZN460 and ZN460AM	-55 to +125°C
for ZN460CP	0 to +70°C
Storage Temperature Range	-55 to +125°C

Fig.4 Gain Test Circuit (ZN460)

The input impedance may be increased at the expense of noise by including R_1 to vary the gain ($R_1 = 0$, gain = 10^3 ; $R_1 = 470\Omega$, gain = 10^2).

C_D is required to decouple the internal feedback loop and in order to obtain a flat frequency response make $C_D \geq C_C$.

The earth lead of the supply decoupling capacitor should be as close as possible to that of R_1 .

R_B may be used to increase the output quiescent current up to a maximum of 5 mA. The value is given by:

$$I_o = \frac{10 (V_{cc} - 1.34)}{R_{s'}}$$

Where R_p' is the parallel combination of R_p and $40K\Omega$.

The gain and bandwidth may be modified by means of R_F and C_F . The gain is given by:

$$A = \frac{10^3 \cdot R_F}{R_F + 19} \text{ with } R_F \text{ in k}\Omega$$

and the bandwidth by :

$$f_c = \frac{10^{12}}{2 \pi R_E' (C_E + 1.4)} \text{ Hz with } C_E \text{ in pF}$$

Where R_F' is the parallel combination of R_F and $19K\Omega$.

The recommended minimum value of R_F is $6k\Omega$ since a lesser value reduces the output swing below $2V_{np}$.
